### Remarks

# Responses

This document is also a response to the Office Action of Restriction Requirement issued on 2006-11-20 and mailed on 2006-12-04 for US patent application 10/709920 which is invented by Chengpu Wang and which claims the benefit of the provisional patent application 60/320250.

### To satisfy the Restriction Requirement:

- 1) Make Claims 1 to 7 depend on Claim 8.
- 2) Cancel Claim 138 to 169 from this application. The inventor may later present them in related patent application(s) claiming the same benefit of the original patent application.

### In addition, to clarify the remaining claims:

- 1) Change globally the name "neighboring register" to "shared register" in order to avoid confusion with "neighboring memory element".
- 2) Incorporate the original Claim 8 into dependent claims to become four other independent claims.
- 3) Cancel some of the original claims and add some new claims.
- 4) Modify some of the original claims and mark them accordingly.

### To help the examination process:

- 1) A Claim Structure section is presented on pages 52-56 of this document. The Claim Structure section shows dependence among claims, as well as a short title to summary each claim. Since this Claim Structure uses jargons to over-simplify the presented claims, it should not be treated as an official part of the application.
- 2) A Similar Claims section is presented on page 56. It groups similar claims together. For example, it shows that the five independent claims are similar, while becoming progressively narrower. For another example, it shows that all claims titled "Matching by priority encoder" are identical except their cited claims.
- 3) A paper draft is attached with this letter, to help understanding the Specification of this patent application by presenting a simplified version of the Specification.

Applicant respectfully submits that no new matter has been added by these amendments.

#### **Claim Structure**

8: broadest independent claim.

It also incorporates old Claim 2, old Claim 15 and old Claim 21.

 $8\rightarrow 2$ : use of the apparatus.

 $8 \rightarrow 1$ : command bit.

 $8 \rightarrow 1 \rightarrow 7$ : use of command bit.

 $8 \rightarrow 1 \rightarrow 4$ : compliance means.

 $8 \rightarrow 1 \rightarrow 4 \rightarrow 5$ : preferred compliance means.

 $8\rightarrow 3$ : termination means for the result means.

 $8\rightarrow 9$ : alternative termination means for the result means.

 $8 \rightarrow 11$ : with instruction micro-kernel.

 $8\rightarrow11\rightarrow170$ : with programmable instruction micro-kernel.

 $8\rightarrow 12$ : use bit storage to enable memory elements.

 $8\rightarrow 14$ : enabled by range decoder.

 $8\rightarrow 171$ : carry number to be constant 1;

 $8\rightarrow15$ : enabled by general decoder.

8→16: preferred maximal carry number.

8→91: parallel processing of concurrent means and exclusive means.

 $8 \rightarrow 91 \rightarrow 90$ : task switching.

27: 8 plus matching.

It is a combination of new Claim 8 and old Claim 27.

 $27 \rightarrow 172$ : enabled by range decoder.

27→173: enabled by general decoder.

 $27\rightarrow28$ : save match bit.

 $27\rightarrow29$ : neighboring means.

 $27\rightarrow30$ : matching by parallel counter.

 $27\rightarrow30\rightarrow31$ : use of matching by parallel counter.

 $27\rightarrow 32$ : matching by priority encoder.

 $27 \rightarrow 32 \rightarrow 174$ : matching by priority high encoder.

 $27 \rightarrow 32 \rightarrow 175$ : matching by priority low encoder.

 $27 \rightarrow 32 \rightarrow 33$ : use of matching by priority encoder.

 $27 \rightarrow 32 \rightarrow 34$ : matching by priority encoder and parallel counter.

 $27 \rightarrow 32 \rightarrow 34 \rightarrow 35$ : use of matching by priority encoder and parallel counter.

 $27 \rightarrow 32 \rightarrow 34 \rightarrow 36$ : enable by general decoder.

 $27 \rightarrow 32 \rightarrow 34 \rightarrow 36 \rightarrow 37$ : additional functionality of parallel divider.

 $27 \rightarrow 32 \rightarrow 34 \rightarrow 36 \rightarrow 37 \rightarrow 38$ : parallel functionality of parallel divider.

 $27 \rightarrow 39$ : status bits.

27→40: predefined matching requirement.

27→41: specified matching requirement.

27→66: simplest content comparable memory.

 $27 \rightarrow 66 \rightarrow 67$ : maskable content comparable memory.

 $27 \rightarrow 66 \rightarrow 73$ : matching by priority encoder.

 $27 \rightarrow 66 \rightarrow 73 \rightarrow 74$ : use of matching by priority encoder.

 $27 \rightarrow 66 \rightarrow 73 \rightarrow 75$ : matching by priority encoder and parallel counter.

 $27 \rightarrow 66 \rightarrow 73 \rightarrow 75 \rightarrow 76$ : use of matching by priority encoder and parallel counter.

80: 8 plus neighboring connections.

It is a combination of new Claim 8 and old Claim 80.

 $80 \rightarrow 81$ : simplest content movable memory.

 $80\rightarrow81\rightarrow176$ : content movable memory that stores data from lowest address.

 $80 \rightarrow 81 \rightarrow 177$ : content movable memory that stores data from highest address.

 $80 \rightarrow 81 \rightarrow 82$ : preferred implementation of content movable memory.

 $80 \rightarrow 81 \rightarrow 83$ : moving means.

 $80 \rightarrow 81 \rightarrow 84$ : content moving means.

 $80 \rightarrow 81 \rightarrow 84 \rightarrow 85$ : address independent means.

 $80 \rightarrow 81 \rightarrow 178$ : dynamic content movable memory with refresh capability.

80→81→178→179: use dynamic content movable memory with refresh capability to replace static random accessible memory.

 $80 \rightarrow 81 \rightarrow 180$ : content movable memory with error detection and correction capability.

92: 8 plus (a) neighboring connections and (b) matching.

It is a combination of new Claim 8, old Claim 80, old Claim 92, and old Claim 96.

92→94: predefined matching requirement.

92→95: specified matching requirement.

 $92 \rightarrow 108$ : status bits.

92→103: enabled by general decoder.

 $92 \rightarrow 103 \rightarrow 181$ : matching by priority encoder and parallel counter.

 $92 \rightarrow 103 \rightarrow 181 \rightarrow 104$ : additional functionality of parallel divider.

 $92 \rightarrow 103 \rightarrow 181 \rightarrow 105$ : parallel functionality of parallel divider.

92→106: content comparable memory with neighboring connections.

- $92 \rightarrow 106 \rightarrow 70$ : use of content comparable memory with neighboring connections.
- 92→106→182: maskable content comparable memory with neighboring connections.
- $92 \rightarrow 106 \rightarrow 99$ : matching by priority encoder.
- $92 \rightarrow 106 \rightarrow 99 \rightarrow 100$ : use of matching by priority encoder.
- $92 \rightarrow 106 \rightarrow 99 \rightarrow 101$ : matching by priority encoder and parallel counter.
- 92→106→99→101→102: use of content comparable memory with neighboring connections.
- 92→112: simplest database memory.

  It also incorporated old Claim 113.
- $92 \rightarrow 112 \rightarrow 183$ : database memory with bit section.
- $92 \rightarrow 112 \rightarrow 184$ : database memory with multiple status bits.
- $92\rightarrow112\rightarrow185$ : database memory with AND/OR logic bits.
- 92→112→115: database memory with more AND/OR logic bits.
- $92 \rightarrow 112 \rightarrow 116$ : matching by priority encoder.
- $92 \rightarrow 112 \rightarrow 116 \rightarrow 186$ : use of matching by priority encoder.
- $92 \rightarrow 112 \rightarrow 116 \rightarrow 187$ : matching by priority encoder and parallel counter.
- $92 \rightarrow 112 \rightarrow 116 \rightarrow 187 \rightarrow 117$ : use of matching by priority encoder and parallel counter.
- $92 \rightarrow 112 \rightarrow 121$ : database memory with incrementing capability.
- $92 \rightarrow 112 \rightarrow 121 \rightarrow 122$ : use of database memory with incrementing capability.
- $92 \rightarrow 112 \rightarrow 123$ : math memory.
- $92 \rightarrow 112 \rightarrow 123 \rightarrow 188$ : math memory with bit-section.
- $92 \rightarrow 112 \rightarrow 123 \rightarrow 125$ : math memory with bitwise logic.
- $92 \rightarrow 112 \rightarrow 123 \rightarrow 125 \rightarrow 189$ : math memory with bit section.
- $92 \rightarrow 112 \rightarrow 123 \rightarrow 125 \rightarrow 189 \rightarrow 190$ : math memory with instruction kernel.

 $92 \rightarrow 112 \rightarrow 123 \rightarrow 191$ : matching by priority encoder.

 $92 \rightarrow 112 \rightarrow 123 \rightarrow 191 \rightarrow 192$ : use of matching by priority encoder.

 $92 \rightarrow 112 \rightarrow 123 \rightarrow 191 \rightarrow 193$ : matching by priority encoder and parallel counter.

92→112→123→191→193→129: use of matching by priority encoder and parallel counter.

194: 8 plus (a) 2D neighboring connections and (b) matching.

194→195: predefined 2D enabling pattern;

 $194 \rightarrow 195 \rightarrow 196$ : refinement of enabling pattern by matching;

194 $\rightarrow$ 197: enabling pattern by X and Y range decoders.

194 $\rightarrow$ 198: enabling pattern by X and Y general decoders.

194→199: image memory.

 $194 \rightarrow 199 \rightarrow 200$ : image memory with bit-section.

 $194 \rightarrow 199 \rightarrow 201$ : image memory with bitwise logic.

 $194 \rightarrow 199 \rightarrow 200 \rightarrow 202$ : image memory with instruction kernel

 $194 \rightarrow 199 \rightarrow 203$ : matching by priority encoder.

 $194 \rightarrow 199 \rightarrow 203 \rightarrow 204$ : matching by priority encoder and parallel counter.

 $194 \rightarrow 199 \rightarrow 203 \rightarrow 204 \rightarrow 131$ : use of image memory for 2D array.

 $194 \rightarrow 199 \rightarrow 203 \rightarrow 204 \rightarrow 205$ : use of image memory for image processing.

206: 8 plus (a) one-side neighboring connection and (b) matching.

206→207: alternative one-side neighboring connection.

206→208: enabled by range decoder

206→209: simplest content searchable memory.

 $206\rightarrow209\rightarrow210$ : maskable content searchable memory.

206→209→211: content searchable memory with search containing wild datum in a datum stream.

 $206\rightarrow209\rightarrow212$ : matching by priority encoder.

 $206\rightarrow209\rightarrow212\rightarrow213$ : use of matching by priority encoder.

 $206\rightarrow209\rightarrow212\rightarrow214$ : matching by priority encoder and parallel counter.

 $206\rightarrow209\rightarrow212\rightarrow214\rightarrow215$ : use of matching by priority encoder and parallel counter.

# **Similar Claims**

The following claims are identical except their respective cited claims:

Enabled by range decoder:

14 172 208 197 (slightly different with others)

Enabled by general decoder:

15 36 103 173

198 (slightly different with others)

Matching by priority encoder:

32 73 99 116 191 203 212 174 175 (slightly different with others)

Matching by priority encoder and parallel counter:

34 75 181 187 193 204 214

Additional functionality of parallel divider

37 104

Parallel functionality of parallel divider

38 105

Status bits:

108 184

With bit-wise logic

125 201

The following claims are similar:

Independent claims:

27 80 92 194 206

Array management:

74 76 100 102 117 129 186 192 213 215

Mini-processor

106 112 199

With bit-section:

183 188 189 200
